

## **Teaching Philosophy**

I believe that every student can learn and succeed when provided with clear instruction, encouragement, and a supportive learning environment. As an educator, my goal is not only to help students master academic content, but also to build their confidence, independence, and problem-solving skills.

My educational background in Mathematics and Education has taught me the importance of presenting concepts in a structured and meaningful way. Mathematics is often viewed as a difficult subject, but I believe students are more likely to succeed when lessons are broken into manageable steps and connected to real-world situations. I strive to create an environment where students feel comfortable asking questions, making mistakes, and learning from those experiences.

My experience as a learning coach for North Carolina Virtual Academy (NCVA) students has given me valuable insight into the challenges and opportunities of online education. Supporting students in a virtual learning environment has reinforced the importance of organization, communication, and individualized support. I have seen firsthand how strong partnerships between teachers, students, and families contribute to student success and help students remain motivated and accountable for their learning.

I recognize that students learn in different ways and at different paces. For this reason, I believe instruction should be flexible and responsive to individual needs. Whether working with students who require additional support or those who are ready for greater challenges, I strive to adapt my approach while maintaining high expectations for all learners.

My Master of Science in Information Technology has further strengthened my appreciation for the role technology plays in modern education. Technology can provide opportunities for engagement, collaboration, and personalized learning when used effectively. I believe educators should continuously learn and adapt to new tools and instructional methods that enhance student achievement.

Ultimately, I believe education should empower students to become confident learners and critical thinkers. My role as an educator is to provide guidance, encouragement, and meaningful learning experiences that help students develop the knowledge and skills necessary for future academic, professional, and personal success.
